Run NVIDIA Nemotron 3 Ultra FREE in Your Terminal

Want to run **NVIDIA's Nemotron 3 Ultra** through a terminal-based AI coding agent — without needing your own GPU?

You can connect NVIDIA's hosted API to **OpenCode** and use the model for coding, planning, reasoning, and agentic workflows.

> **Note:** NVIDIA currently offers a free endpoint, but availability, limits and trial terms can change.

What You Need

- A terminal
- A free NVIDIA account
- OpenCode
- An NVIDIA API key
- **No local GPU required** for the hosted API

---

1. Get Your NVIDIA API Key

Open the official NVIDIA model page:

NVIDIA Nemotron 3 Ultra — Get API Key

1. Sign in/create your NVIDIA account.
2. Open the Nemotron 3 Ultra model page.
3. Click **Generate API Key**.
4. Copy the API key.

Your key will look similar to:

nvapi-xxxxxxxxxxxxxxxx

Never share your API key publicly.

---

2. Install OpenCode

Open your terminal and run:

curl -fsSL https://opencode.ai/install | bash

Or install with npm:

npm install -g opencode-ai

Official OpenCode docs:

OpenCode Documentation

---

3. Connect NVIDIA to OpenCode

Go to the folder/project where you want to use OpenCode:

cd /path/to/your/project

Then start OpenCode:

opencode

Inside OpenCode, run:

/connect

Select:

NVIDIA

Then paste your NVIDIA API key.

OpenCode's official NVIDIA provider instructions confirm this `/connect` → NVIDIA → API key flow.

---

4. Select Nemotron 3 Ultra

Inside OpenCode, run:

/models

Then search/select:

nvidia/nemotron-3-ultra-550b-a55b

That's the official NVIDIA model ID.

---

5. Start Building

Now give OpenCode a coding task.

For example:

Build a premium landing page with a glossy 3D object.

Use a modern, polished UI with smooth animations,
responsive design, and production-quality code.

OpenCode can then work with the connected model as a terminal-based coding agent.

Optional: Configure NVIDIA Manually

Instead of using `/connect`, you can configure the NVIDIA provider in:

~/.config/opencode/opencode.json

Example:

```
{
  "$schema": "https://opencode.ai/config.json",
  "provider": {
    "nvidia": {
      "npm": "@ai-sdk/openai-compatible",
      "name": "NVIDIA NIM",
      "options": {
        "baseURL": "https://integrate.api.nvidia.com/v1",
        "apiKey": "nvapi-YOUR_KEY_HERE"
      },
      "models": {
        "nvidia/nemotron-3-ultra-550b-a55b": {
          "name": "Nemotron 3 Ultra",
          "limit": {
            "context": 1000000,
            "output": 16384
          }
        }
      }
    }
  }
}
```

Then launch:

opencode

and use:

/models

to select the model.

Important Details

Model: `nvidia/nemotron-3-ultra-550b-a55b`

NVIDIA API endpoint:

https://integrate.api.nvidia.com/v1

Context: Up to 1M tokens

Total parameters: 550B-class model / NVIDIA lists 561B in the endpoint specifications

Active parameters: 55B

Use cases: Agentic reasoning, coding, planning, tool calling and long-context tasks.
